## <sup>6</sup> Summary

<sup>7</sup> This collection of tutorials is an introduction to the GRASS geospatial processing engine. <sup>8</sup> GRASS is an open source computational engine for spatiotemporal data management, analysis, <sup>9</sup> modeling, and simulation ([GRASS Development Team et al., 2025](#); [Neteler & Mítášová, 2008](#)). <sup>10</sup> As an engine that can be integrated in data science pipelines with shell scripting, Python, R, <sup>11</sup> Jupyter, and Colab, there are many ways to use GRASS. While GRASS already had extensive <sup>12</sup> documentation of individual processing tools, tutorials were needed to introduce the many <sup>13</sup> ways to interface with the tools and combine them into computational workflows ([Figure 1](#)). <sup>14</sup> These open education tutorials - which cover integrations, core features, and disciplinary <sup>15</sup> applications - were developed as part of an effort to grow the GRASS community. The <sup>16</sup> tutorials are built with Quarto and are deployed as webpages paired with Jupyter computational <sup>17</sup> notebooks. The tutorials are available at <https://grass-tutorials.osgeo.org> under both the GNU <sup>18</sup> Free Documentation License v1.2 or later and the Creative Commons Attribution-ShareAlike <sup>19</sup> 4.0 International License.

Fractal terrain generated with GRASS and eroded with LandLab

**Figure 1:** An example of eroded fractal terrain from a [tutorial](#) on scientific modeling with GRASS and Landlab. This tutorial demonstrates a seamless workflow for scientific modeling in Python, showing how gridded data can be passed as arrays between GRASS, NumPy ([Harris et al., 2020](#)), and Landlab ([Barnhart et al., 2020](#)).

## <sup>20</sup> Statement of Need

<sup>21</sup> As GRASS has grown from its roots as a geographic information system ([Westervelt, 2004](#)), it <sup>22</sup> has evolved into a geocomputational engine with many interfaces. As an engine, it can be <sup>23</sup> integrated in geospatial data science pipelines using shell scripting, application programming <sup>24</sup> interfaces, tangible interfaces ([Petrášová et al., 2018](#)), computational notebooks ([Haedrich <sup>25</sup> et al., 2023](#)), cloud computing environments ([Neteler et al., 2019](#); [White et al., 2023](#)), or <sup>26</sup> high performance computing environments. While GRASS is well documented with books, a <sup>27</sup> user manual, developer manuals, and a wiki, it lacked official tutorials. Over the years, the

28 community developed many tutorials across different platforms, but as these are independently  
29 maintained, many have become outdated and obsolete. The current roadmap for GRASS  
30 – established in 2024 – calls for official new tutorials to encourage community growth and  
31 demonstrate integrations in data science pipelines.

32 The design and implementation of the new official tutorials for GRASS was based on experience  
33 teaching university courses and conference workshops using open educational resources. Over  
34 the last decade, the GRASS community has developed many open educational resources,  
35 experimenting with delivery via web documents, computational notebooks, and cloud computing  
36 services. Online tutorials for GRASS have been built from source in HTML (Petráš et al., 2015),  
37 built from Markdown with a static site generator (Harmon, 2020), included Jupyter notebooks  
38 (Haedrich et al., 2023), and used cloud computing services such as Binder (Petrášová & Petráš,  
39 2019), Whole Tale (Andreо, 2023b), and Google Colab (Andreо, 2023a). Petráš et al. (2015)  
40 used a modular structure with tabs to teach the core interfaces for GRASS – the GUI, CLI,  
41 and Python API – separating explanatory text introducing geospatial concepts from software  
42 specific text for each interface. This scaffolding helps learners to focus on concepts, while  
43 building their skills with increasingly complex interfaces. Haedrich et al. (2023) developed  
44 the GRASS–Jupyter integration to incorporate more scripting into a graduate-level course on  
45 Geospatial Computing and Simulation. The package extends the existing GRASS Python APIs  
46 with data visualization and management tools for the Jupyter environment. The new course  
47 materials include Jupyter Notebooks that combine tutorials and assignments, allowing students  
48 to write and modify code, interact with examples, and explain their reasoning in markdown,  
49 all within a single document. Based on these experiences, our design principles for the new  
50 tutorials include teaching geospatial concepts discretely from software specifics to encourage  
51 spatial thinking, supporting live coding to encourage computational thinking, and using an  
52 open source publishing system to build documents from plain text tracked with version control.

## 53 Description

### 54 Learning Objectives

55 This collection of tutorials was designed to teach geocomputational thinking using the GRASS  
56 geoprocessing engine. To introduce computational approaches (National Research Council,  
57 2010; Weintrop et al., 2016) to thinking about space and time, the tutorials cover the  
58 fundamentals of geoprocessing with GRASS, integrations of GRASS into data science pipelines,  
59 and disciplinary applications of GRASS. The tutorials were designed for self-study by learners  
60 of all levels, integration into courses, and deployment in workshops.

### 61 Instructional Design

62 In order to teach a computational approach to thinking about spatiotemporal phenomena  
63 through different interfaces to the GRASS engine, the tutorials were designed:

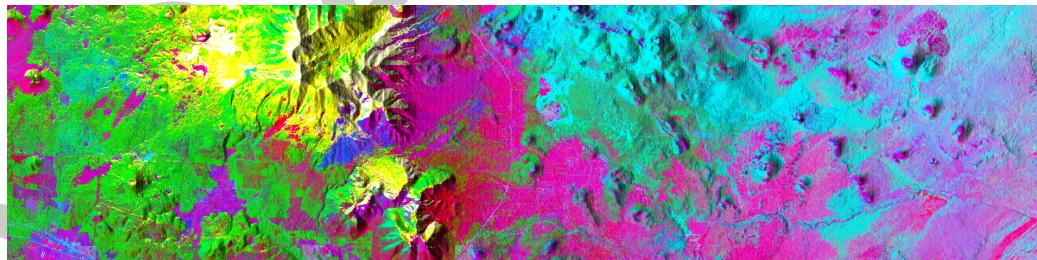

- 64     ■ as modules for reuse and remixing,
- 65     ■ as worked examples to reduce cognitive load,
- 66     ■ as interactive lessons for active learning and engagement,
- 67     ■ as scaffolded prose and code to structure learning,
- 68     ■ and as computable content to teach computational thinking.

69 Drawing on the education benefits of computational notebooks (Barba et al., 2022), the  
70 tutorials introduce geocomputational concepts through worked examples that synthesize prose  
71 explanations, graphics, and executable code. The tutorials, which range from introductory  
72 to advanced, have a modular design for reuse and remixing so that learners can choose their  
73 own course of study and teachers can select modules for their lesson plans. The tutorials  
74 build in complexity from introductory to core to disciplinary modules. A set of getting-started  
75 tutorials introduce different ways to interface with the GRASS engine. The core tutorials cover

76 important concepts such as geovisualization ([Figure 2](#)), map algebra ([Figure 3](#)), geospatial  
77 modeling, and the temporal framework. Disciplinary tutorials demonstrate applications for  
78 GRASS in domains such as climatology, ecology, hydrology, geomorphology. The disciplinary  
79 tutorials build engagement by working through applications in the learner's domain and thus  
80 motivate further exploration. Throughout the tutorials, different ways to interface with GRASS  
81 are presented as tabs in code blocks, so that learners can work their way through the same  
82 tutorial repeatedly using increasingly challenging interfaces – building proficiency first with the  
83 graphical user interface (GUI), then with the command line interface (CLI), and finally with  
84 the Python or R application programming interfaces (API).

## 85 Implementation

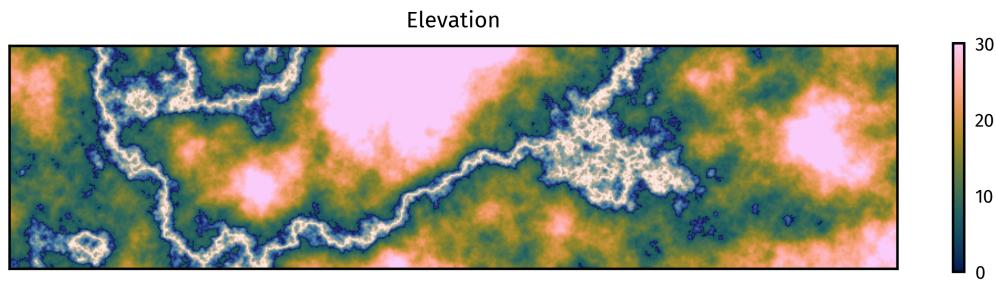

86 This collection of tutorials was published as web documents paired with computational  
87 notebooks. To reach a broad audience, the tutorials are published as web documents for  
88 immediate, easy access via web browsers. When appropriate, web documents are accompanied  
89 by a downloadable computational notebook, encouraging interactivity, engagement, and  
90 geocomputational thinking. The tutorials – which are built and deployed using the Quarto  
91 scientific publishing system ([Allaire et al., 2025](#)) – are written in Markdown with YAML  
92 frontmatter. Tutorials are composed in Markdown for human-readable source code, efficient  
93 version control, executable code blocks for different interfaces, rendering in multiple formats,  
94 and reproducibility. As this open education project aims to teach different ways to interface  
95 with GRASS, executable code for multiple relevant interfaces such as the GUI, CLI, Python, or  
96 R can be included in tutorials as tabs. Once tutorials have been written, they are reviewed  
97 by the GRASS Development Team, rendered as web documents and Jupyter notebooks, and  
98 deployed to an Open Source Geospatial Foundation website. The source code for the tutorials  
99 is built in the GitHub repository <https://github.com/OSGeo/grass-tutorials> and deployed to  
100 the website <https://grass-tutorials.osgeo.org> using GitHub Actions.

**Figure 2:** An example of image fusion of principal components analysis of multi-band images of the San Francisco volcanic field from a [tutorial](#) introducing the basics of remote sensing in GRASS. This tutorial demonstrates how to process and visualize multi-band remote sensing imagery.

## 101 Content

102 This official collection of tutorials is maintained by the GRASS Development Team as part  
103 of the documentation for the GRASS geocomputational engine ([Table 1](#)). This ensures that  
104 tutorials are standardized, undergo rigorous review, and are maintained and updated as GRASS  
105 evolves. The website also includes a curated collection of external tutorials that are hosted  
106 and maintained by their creators ([Table 2](#)).

**Figure 3:** An example of synthetic terrain generated using map algebra from a [tutorial](#) introducing the basics of map algebra in GRASS. This tutorial demonstrates local algebraic operations using the raster map calculator, focal operations using nearest neighbors analysis, zonal operations using conditional statements with the raster map calculator, and global operations using raster metadata.

**Table 1:** Official GRASS tutorials

Modules	Tutorials	Level	Lang.
Integrations	Get started with GRASS GUI	Beginner	En
	Get started with GRASS & Python in Jupyter Notebooks	Beginner	En
	Get started with GRASS in Google Colab	Beginner	En
	Get started with GRASS in Jupyter Notebooks on Windows	Beginner	En
	Quick comparison: R and Python GRASS interfaces	Intermediate	En
	Get started with GRASS & R: the rgrass package	Advanced	En
	Basics of map algebra	Beginner	En
	Making plots with GRASS	Beginner	En
	Visualizing and modeling terrain from DEMs in GRASS	Beginner	En & Pt
	Introduction to remote sensing with GRASS	Beginner	En
Core	Making thematic maps	Beginner	En
	Introduction to time series in GRASS	Intermediate	En
	Temporal subset, import and export	Intermediate	En
	Temporal aggregations	Advanced	En
	Temporal algebra	Advanced	En
	Temporal accumulation	Advanced	En
	Temporal gap-filling	Advanced	En
	Temporal query with vector data	Advanced	En
	Modeling movement in GRASS	Advanced	En & Pt
Disciplinary	Basic earthworks	Beginner	En
	Gully modeling	Beginner	En
	Coastal infrastructure	Beginner	En
	Terrain synthesis	Intermediate	En
	Procedural noise	Intermediate	En
	Hydro-flattening a digital elevation model	Intermediate	En
	Using GRASS, NumPy, and Landlab for scientific modeling	Intermediate	En
	fasterRaster: faster raster processing in R Using GRASS	Intermediate	En
	Estimating wind fetch	Advanced	En
	Parallelization of overland flow simulation	Advanced	En

**Table 2:** External tutorials

Modules	Tutorials	No.	Level	Lang.
Integrations	Unleash the power of GRASS	5	Beginner - Advanced	En
	GRASS for remote sensing data processing with Jupyter Notebooks	1	Advanced	En
Core	NCSU geospatial modeling and analysis course	13	Beginner - Intermediate	En
	Geoprocessamento com GRASS	1	Beginner - Intermediate	Pt
Disciplinary	Tutoriales de GRASS en grasswiki	4	Beginner - Intermediate	Es
	GISMentors	30	Beginner - Advanced	En & Cs
Deforestation study using GRASS		1	Beginner	En
	Teledetección, OBIA y series de tiempo	5	Beginner - Advanced	Es
GIS for designers		12	Beginner - Intermediate	En
	GRASS for environmental monitoring and disease ecology	2	Beginner - Intermediate	En
Processing lidar and UAV point clouds		1	Beginner - Intermediate	En
	Physically-based hydrologic modeling using GRASS r.topmodel	1	Intermediate	En
Spatio-temporal data handling and visualization		1	Intermediate	En
	Ecodiv.earth tutorials	16	Beginner - Advanced	En
Ecodiv.earth tutorials	Urban growth modeling with FUTURES	1	Advanced	En

## 107 Acknowledgements

108 The initial development of these tutorials was partially supported by the U.S. National Science  
 109 Foundation under Grant [2303651](#).
